ComfortCut

Adaptive Knife Handle

An adaptive knife designed for seated users to cut safely and comfortably

Parapalegic hunters, who cut and package their own meat, are at risk of causing **repetitive use injuries** and excessive shoulder strain while using **improper cutting equiptment** and cutting for long periods of time in a seated position.

Design Opportunity

While observing Vijay, **an adaptive hunter,** I noticed that **cutting from a seated position** caused significant pain over time.

This revealed a design opportunity to **create a knife that would allow Vijay to adjust his hand positioning**, making cutting safer and more comfortable.

Ideation

Through my exploration of iterations of handle angles and grip styles, I decided on a **90 degree orientation** with **piston-grip inspired handles** to reduce strainand improve cutting control for seated users.

This project pushed me out of my comfort zone, challenging me to work with new materials, learn new tools, and create something beautiful. It expanded my creativity and encouraged me to push the boundaries of what I was capable of achieving.

Starting with just a block of wood and shaping it into something functional and beautiful showed me that I can create anything with my own two hands.

Most importantly, designing something that could make someone else's life a little easier made the process even more meaningful.
