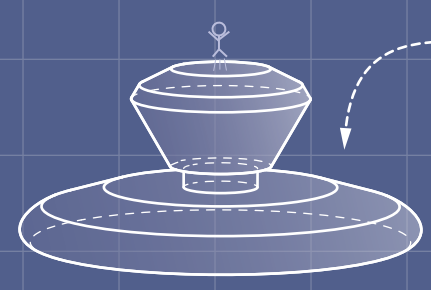
WATER WARMER UPPER

A Water Warmer Upper is what people use to warm up water easily. The bottom has hot power that warms up the water inside. Water goes in the middle part, but don't put too much. Flip the on/off piece on the bottom to start the power.

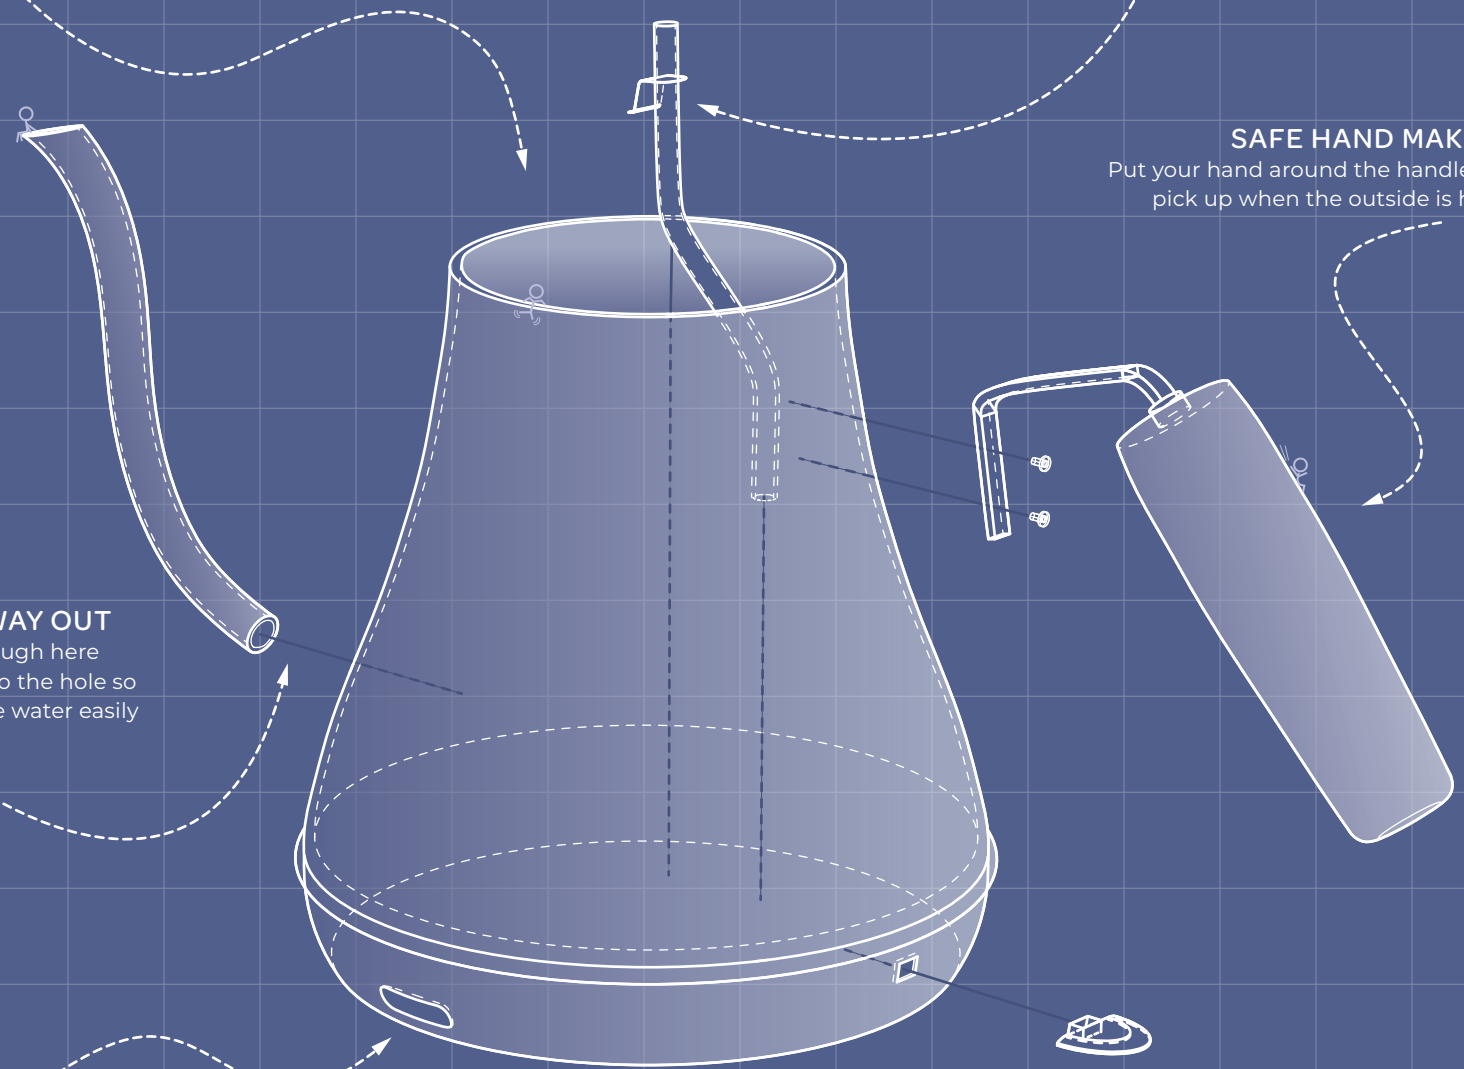
After a minute, the water becomes really hot so you can make drinks. Wait for it to flip off on its own because the water is done. People use a Water Warmer Upper because it is quick and easy and safe.



HOT WATER COVER
This is the top that keeps the water warm and keeps the water from coming out of the top when the water gets hot and moves around.

WATER FILL UP SPOT
The water that you want to make hot goes in here. Make sure to only fill with water to the line so that the water does not come out of the top when the power is on.

WATER HEIGHT SPOT
If the water is too high it will go through here and come out of the bottom so that it is safe and does not hurt you when the water is hot.

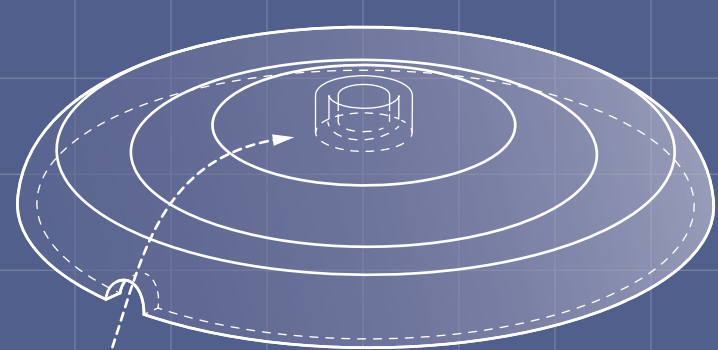


SAFE HAND MAKER
Put your hand around the handle to pick up when the outside is hot.

THE WATER'S WAY OUT
The water goes through here from the middle into the hole so that you can put the water easily into a cup.

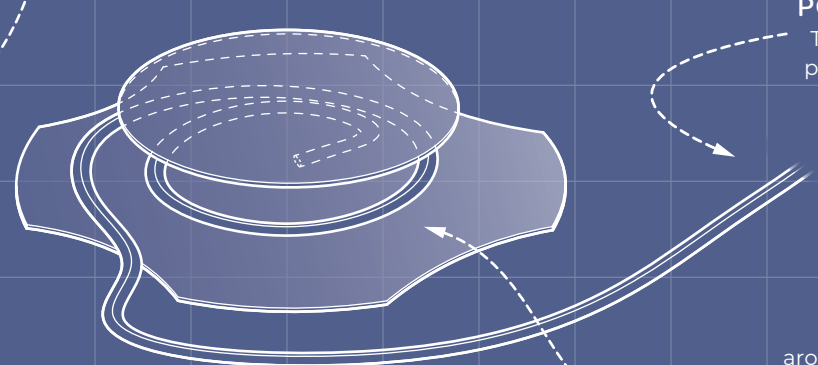
ON/OFF SIGN
This light turns on when you flip the on/off piece to show that the power is on and that the water is getting hot. When the light is --off the water is done and is very hot.

POWER FLIP ON/OFF
Push this piece down to turn on the Water Warmer Upper and start making the water hot. This is how you turn the Water Warmer Upper on and off.



POWER FOR WATER
The bottom of the Water Warmer Upper goes here to touch the power. The power warms up the water inside to make it super hot.

POWER FROM THE WALL
This goes into the wall and the power goes through the power line to the bottom where the water gets warmed up.



POWER LINE KEEPER
You can wrap the power line around the bottom to keep it out of the way and to make sure it does not get hot.
